

**COLLAPSIBLE TREADMILL CAPABLE OF BEING AUTOMATICALLY
SECURED TO A COLLAPSED POSITION**

ABSTRACT OF THE DISCLOSURE

5 A collapsible treadmill includes a base, a treadbase pivotably mounted on the
base, a retractable member having a cylinder and a bar fitted into cylinder. The cylinder
is pivotably mounted on the base at an end thereof. The bar is pivotably mounted on the
treadbase. A sleeve is fitted onto the cylinder and pivotably mounted on the treadbase
together coaxially with the bar. A locking member is pivotably mounted on the sleeve
10 and has a stop lug to be inserted into a stop slot of the sleeve. A biasing member keeps
the stop lug of the locking member inserted into the stop slot and engaged against an
outer periphery of the cylinder. When the treadbase is at a collapsed position, the
locking member can be driven to engage against a distal end surface of the cylinder,
thereby automatically securing the treadbase to the collapsed position.
